

Membangun Web Server dengan Nginx + PHP-FPM

- Nginx (Engine X) adalah salah satu web server yang mempunyai performa tinggi dan dapat digunakan sebagai reverse proxy, load balancing, cache header, gzip dan masih banyak lagi.
- Nginx dibangun untuk mengatasi masalah 10K atau 10.000 Concurrent Connection (koneksi bersamaan) oleh pengguna.

Step by step Web Server dengan Nginx + PHP-FPM

1. Instalasi **Debian 11**
2. Konfigurasi **Network (static/dhcp)**
3. Menambahkan **Repository Debian 11 Bullseye** menggunakan **server local sekolah**

```
# nano /etc/apt/sources.list
```

```
deb [trusted=yes] http://10.233.233.2/ nnkrepo main
deb-src [trusted=yes] http://10.233.233.2/ nnkrepo main
```

4. Setelah repository ditambahkan ketikan:

```
# apt update
# apt upgrade
```

5. Install **SSH Server** untuk remote server dari computer client

```
# apt install openssh-server
```

Letak File konfigurasi ssh server

```
# nano /etc/ssh/sshd_config
```

6. Install **FTP Server** untuk upload download ke server

```
# apt install proftpd
```

Letak File Konfigurasi FTP Server

```
# nano /etc/proftpd/proftpd.conf
```

7. Install Nginx / Web Server

```
# apt install nginx
```

Menjalankan, mengatur autostart, dan mengecek status service Nginx apakah sudah start (active/running) dan enable.

```
# systemctl start nginx  
# systemctl enable nginx  
# systemctl status nginx
```

Browse <http://IP-server> untuk menguji apakah Nginx web server sudah dapat diakses dan berjalan dengan baik.

8. Install PHP 7.4 dan extensionnya

Install PHP v7.4, extension PHP-FPM, berserta extension lain yang umumnya dibutuhkan oleh aplikasi berbasis PHP termasuk WordPress

```
# apt install php7.4 php7.4-fpm php7.4-mysql php7.4-cli php7.4-common php7.4-json  
php7.4-opcache php7.4-mbstring php7.4-zip php7.4-gd php7.4-curl php7.4-xml php7.4-  
bcmath php7.4-json
```

Memverifikasi hasil install PHP dengan menampilkan versi PHP

```
# php -v
```

Memeriksa status service PHP-FPM versi 7.4. Pastikan service harus active (running) dan enabled

```
# systemctl status php7.4-fpm
```

9. Konfigurasi nginx agar bekerja dengan PHP

Nginx harus menambahkan konfigurasi di server block agar dapat terhubung ke socket PHP-FPM.

Membuka file konfigurasi server block bawaan nginx, sebelum di edit di backup terlebih dahulu

```
# cp /etc/nginx/sites-available/default default-backup
```

Konfigurasi file nginx

```
# nano /etc/nginx/sites-available/default
```

```
server {  
    listen 80;  
    server_name www.domain domain;  
    root /var/www/html;  
    index index.php index.html index.htm;  
    location / {  
        try_files $uri $uri/ /index.php?$query_string;  
    }  
    location ~ \.php$ {  
        try_files $fastcgi_script_name =404;  
        include fastcgi_params;  
        fastcgi_pass unix:/run/php/php7.4-fpm.sock;  
        fastcgi_index index.php;  
        fastcgi_param DOCUMENT_ROOT $realpath_root;  
        fastcgi_param SCRIPT_FILENAME  
        $realpath_root$fastcgi_script_name;  
    }  
    access_log /var/log/nginx/domain_access.log;  
    error_log /var/log/nginx/domain_error.log;  
}
```

Menguji apakah ada kesalahan syntax pada konfigurasi server block, restart service Nginx dan cek statusnya

```
# systemctl restart nginx  
# nginx -t  
# systemctl status nginx
```

10. Pengujian PHP

```
# nano /var/www/html/phpinfo.php
```

ketikan atau isi kode php kemudian save

```
<?php phpinfo(); ?>
```

akses di browser client dengan url http://ip_server/phpinfo.php (harus menampilkan halaman phpinfo.)

PHP Version 7.4.33	
System	Linux svr 5.10.0-22-amd64 #1 SMP Debian 5.10.178-3 (2023-04-22) x86_64
Build Date	Feb 22 2023 20:07:47
Server API	FPM/FastCGI
Virtual Directory Support	disabled
Configuration File (php.ini) Path	/etc/php/7.4/fpm
Loaded Configuration File	/etc/php/7.4/fpm/php.ini
Scan this dir for additional .ini files	/etc/php/7.4/fpm/conf.d
Additional .ini files parsed	/etc/php/7.4/fpm/conf.d/10-mysqldnd.ini, /etc/php/7.4/fpm/conf.d/10-opcache.ini, /etc/php/7.4/fpm/conf.d/10-pdo.ini, /etc/php/7.4/fpm/conf.d/15-xml.ini, /etc/php/7.4/fpm/conf.d/20-calendar.ini, /etc/php/7.4/fpm/conf.d/20-ctype.ini, /etc/php/7.4/fpm/conf.d/20-curl.ini, /etc/php/7.4/fpm/conf.d/20-dom.ini, /etc/php/7.4/fpm/conf.d/20-exif.ini, /etc/php/7.4/fpm/conf.d/20-fil.ini, /etc/php/7.4/fpm/conf.d/20-fleinfo.ini, /etc/php/7.4/fpm/conf.d/20-ftp.ini, /etc/php/7.4/fpm/conf.d/20-gd.ini, /etc/php/7.4/fpm/conf.d/20-gettext.ini, /etc/php/7.4/fpm/conf.d/20-iconv.ini, /etc/php/7.4/fpm/conf.d/20-imap.ini, /etc/php/7.4/fpm/conf.d/20-intl.ini, /etc/php/7.4/fpm/conf.d/20-json.ini, /etc/php/7.4/fpm/conf.d/20-mysqli.ini, /etc/php/7.4/fpm/conf.d/20-pdo_mysqli.ini, /etc/php/7.4/fpm/conf.d/20-phar.ini, /etc/php/7.4/fpm/conf.d/20-posix.ini, /etc/php/7.4/fpm/conf.d/20-readline.ini, /etc/php/7.4/fpm/conf.d/20-shmop.ini, /etc/php/7.4/fpm/conf.d/20-simplexml.ini, /etc/php/7.4/fpm/conf.d/20-sockets.ini, /etc/php/7.4/fpm/conf.d/20-sysvmsg.ini, /etc/php/7.4/fpm/conf.d/20-sysvsem.ini, /etc/php/7.4/fpm/conf.d/20-sysvshm.ini, /etc/php/7.4/fpm/conf.d/20-tidy.ini, /etc/php/7.4/fpm/conf.d/20-tokenizer.ini, /etc/php/7.4/fpm/conf.d/20-xsl.ini, /etc/php/7.4/fpm/conf.d/20-xwriter.ini, /etc/php/7.4/fpm/conf.d/20-zip.ini

11. Konfigurasi php.ini untuk PHP-FPM

Membuka file konfigurasi php.ini v7.4 untuk PHP-FPM

```
# nano /etc/php/7.4/fpm/php.ini
```

Opsi variabel konfigurasi serta nilai yang diberikan, sesuaikan dengan kebutuhan

```
upload_max_filesize = 10M
post_max_size = 10M
max_execution_time = 300
max_input_time = 300
memory_limit = 128M
```

Restart service PHP-FPM, lalu browse kembali halaman phpinfo untuk melihat apakah konfigurasi PHP sudah berubah

```
# systemctl restart php7.4-fpm
```

```
# systemctl status php7.4-fpm
```

12. Download Web Bootstrap template di <https://bootstrapmade.com/>

- 13. Mariadb Database (Terlampir)**
- 14. Install **Phpmyadmin** (Terlampir)**
- 15. Instalasi **CMS Wordpress** (Terlampir)**
- 16. Install **Tiny File Manager** (Terlampir)**
